FLUID

PREMIUM HANDLE WITH INTEGRAL WATERTIGHT

Creating smart textiles isn't enough, you then need the right equipment to use them! So we had to dive right in to develop *Fluid*. Starting from scratch, *Fluid* revolutionised the design and ergonomics of fillable handles. It was even nominated for a design prize in Paris and was exhibited at the "Cit  des Sciences et de l'Industrie" science museum for 6 months.

Its slender, elegant appearance gives it perfect balance by distributing the weight of the liquid along the handle. *Fluid* weighs just 600 g, a featherweight in its category! The ergonomics are well thought out by its designers, down to the smallest detail, with a rotary handle and globe to accompany the movements of the wrists. The ring opening reveals the filling aperture positioned along the handle for easy access under the tap. A filling bottle is also provided for this purpose.

The coloured tripod is positioned naturally under your fingers to trigger the mechanism and release the liquid in 3 jets in front of the frame. It comes in four colours for your convenience to define the different work environments and prevent cross-contamination. *Fluid's* level indicator keeps you constantly up-to-date with where you are.

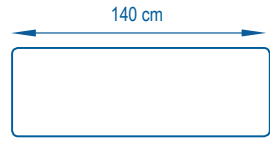

Its half-litre capacity enables you to work on surfaces up to 140 m². No bucket or trolley needed. *Fluid* works miracles on stairs, in emergencies and in cutting-edge cleaning.

In combination with the disposable microfiber (*Dispomop*[®] and *ULTIMATE Dispomop*[®]) or short life (*Dispomop*[®] 3D and *ULTIMATE 3D*) mops from the DECITEX range, it is indispensable.

Industry

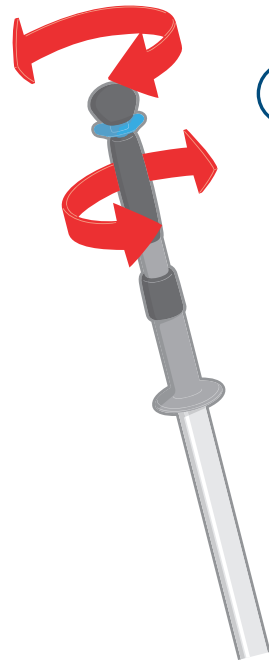

①

Pour 500 ml of the solution into the handle

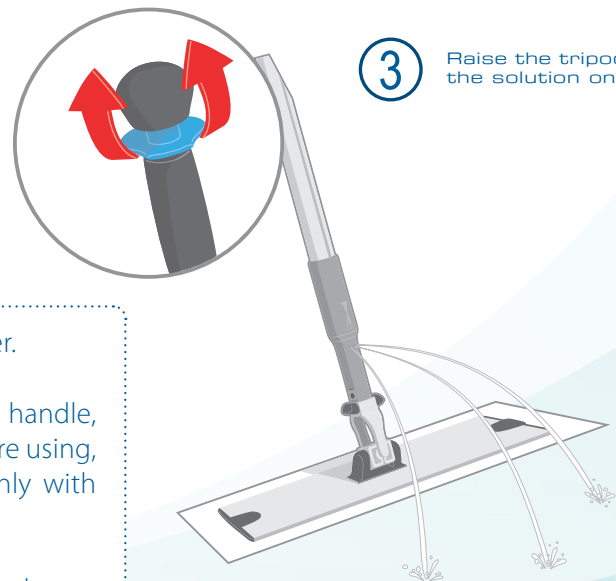

②

Handle can swivel for comfort

③

Raise the tripod to dispense the solution onto the floor

Every nights: drain and flush the handle with clean water.

Once a month: dilute an anti-limescale solution in the handle, leave on according to the procedure of the product you are using, then drain the handle using the tripod. Rinse thoroughly with plenty of clean water.

Every now and then: if the streams delivery look blocked, pass a needle or a paper clip through the streams delivery to unblock them so that the liquid can flow through again easily.
